## EPIDEMIOLOGIC NOTES AND REPORTS

## SALMONELLOSIS - Georgia

A large outbreak of salmonella gastroenteritis has been traced to a New Year's Eve party at which a buffet dinner was served. From an incomplete list of approximately 540 guests, 116 persons were interviewed by telephone for clinical and food histories. Of these, 51 (44 percent) were ill with watery diarrhea, cramps, vomiting, headache, and fever of 101°–103°; three persons were briefly hospitalized. The mean incubation period was 22½ hours and the illness lasted from 2 to 4 days. *Salmonella st. paul* has been recovered from stool specimens from five of the patients.

Measles – 1967	..... 10
Surveillance Summary	.....
Meningococcal Infections – 1967	..... 11

Food histories clearly incriminated a turkey salad made from commercially prepared, precooked frozen turkey rolls and salad ingredients. The same salad ingredients were used in other salads which were not implicated, and cold sliced turkey from the same lot as the turkey rolls was served separately but not implicated. None of the

## EPIDEMIOLOGIC NOTES AND REPORTS

## SALMONELLOSIS - Georgia

(Continued from front page)

served food was available for culture. The kitchen employees denied symptoms of gastroenteritis, but 6 of 14 stool cultures obtained from them grew *Salmonella st. paul*. All six employees with positive cultures had a hand in preparing the turkey salad and admitted that they had eaten a portion during preparation.

Cultures from the environment and from food ingredi-

ents were negative for salmonellae. Several studies are in progress, including a more extensive sampling of the turkey rolls from the same commercial shipment.

(Reported by Dr. John McCroan, Director, Section of Biologic Studies, and Mr. Tom McKinley, Assistant State Epidemiologist, Georgia Department of Public Health; and two EIS Officers.)

CURRENT TRENDS  
MEASLES - 1967

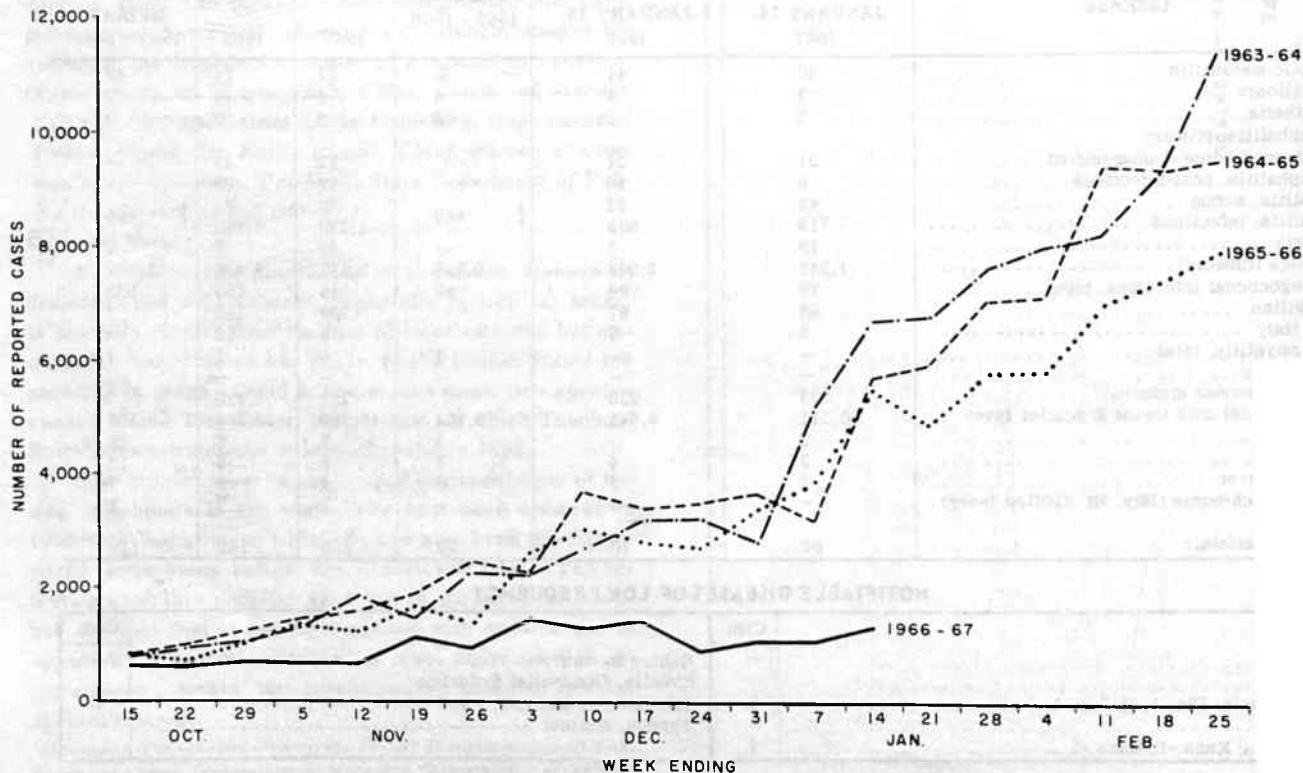

The low level of reported measles in the 1966-67 epidemiologic year continued during the week ending January 14 when 1,345 cases were recorded. This total is 273 cases higher than the total of 1,072 for the week ending January 7, but is 4,199 cases less than the total of 5,544 reported for the comparable week in 1966.

Thirty percent of the current week's total number of

cases were reported from Texas (298 cases) and Washington (110 cases). Seven additional states reported more than 50 cases. Nine states reported less than five cases, and no cases were reported from eight states.

(Reported by the Childhood Viral Diseases Section, Epidemiology Program, NCDC.)

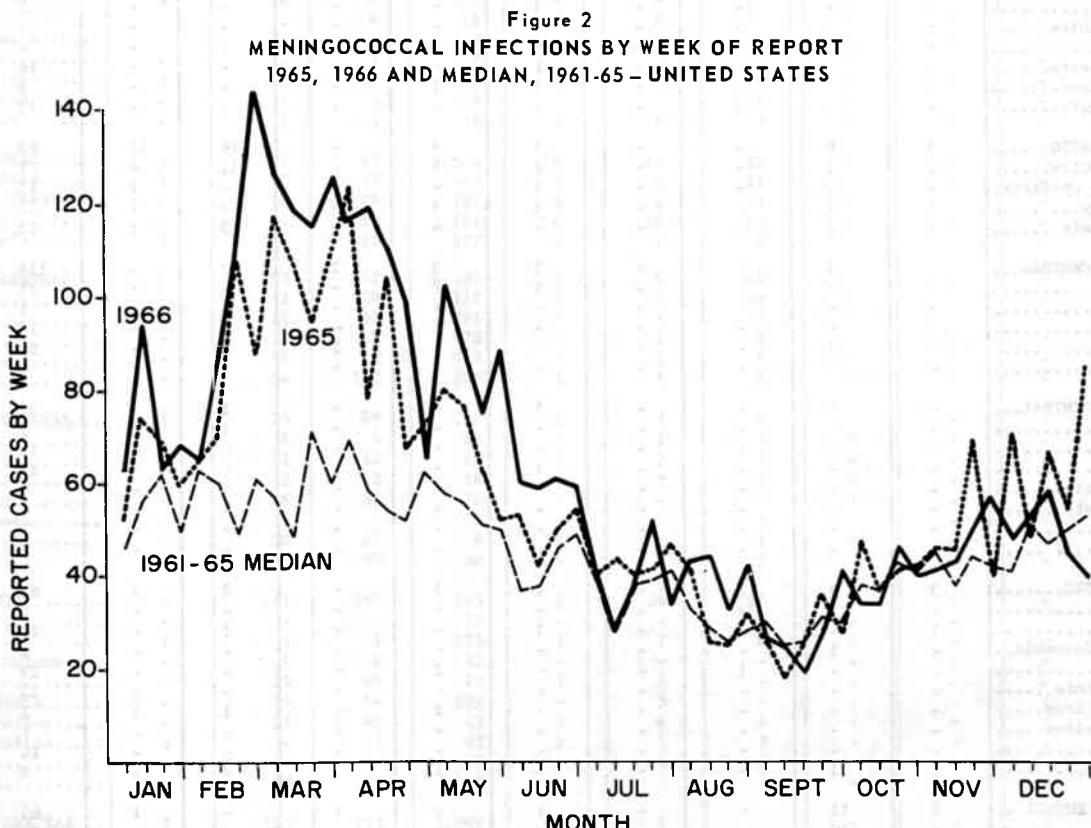

Figure 1  
REPORTED MEASLES IN THE UNITED STATES  
1966-67 COMPARED WITH 1963-64 TO 1965-66

**ANNUAL SURVEILLANCE SUMMARY  
MENINGOCOCCAL INFECTIONS - 1966**

The total of 3,873 meningococcal infections reported to the National Communicable Disease Center during 1966 represents an increase of 10.6 percent over the 1965 total of 3,051 cases. Most of this increase occurred from March through June 1966; since July the weekly totals have closely followed those of the previous years (Figure 2).

Of the 1966 total, 331 cases (9.8 percent) were reported from military installations; 80 percent of these cases were from California, Louisiana, New Jersey, Kentucky, Texas, South Carolina, and Missouri. In contrast, only 7 percent of total cases in 1965 were reported from the military.

The 1966 attack rate for meningococcal infections in the United States was 1.7 per 100,000. As shown in Figure 3, this represents a continuation of the mild upward trend in attack rates which has been evident since 1962.

**Figure 3  
MENINGOCOCCAL INFECTIONS-ANNUAL RATE  
PER 100,000 - UNITED STATES, 1920-65**

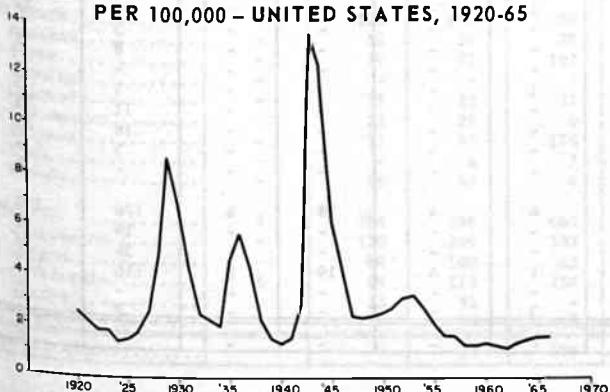

Table 1 presents the analysis by serogroup of 776 strains of *Neisseria meningitidis* which were isolated mainly from blood or cerebrospinal fluid in 1966. As anticipated on the basis of experience in 1964 and 1965, the predominant serogroup was again group B, comprising approximately 70 percent of the total number of strains.

**Table 1  
Strains of *Neisseria meningitidis*  
Submitted to NCDC - 1966**

Serogroup	Number	Percent
A	2	0.25
B	548	70.6
C	98	12.6
D	2	0.25
Not typed & "rough" strains	126	16.3
Total	776	100.0

## MENINGOCOCCAL INFECTIONS - 1966

(Continued from page 11)

The sulfadiazine sensitivity of meningococci submitted to the NCDC from 1964 to 1966 is shown in Figure 4. The pattern of sulfadiazine sensitivity of strains isolated in 1966 was quite similar to that observed in 1965, especially at minimum inhibitory concentrations of 1 milligram percent or less. There was, however, a higher proportion of strains in 1966 that required 5 milligrams percent or more for inhibition. Forty percent of the 1966 strains were resistant to a concentration of 1 milligram percent of sulfadiazine.

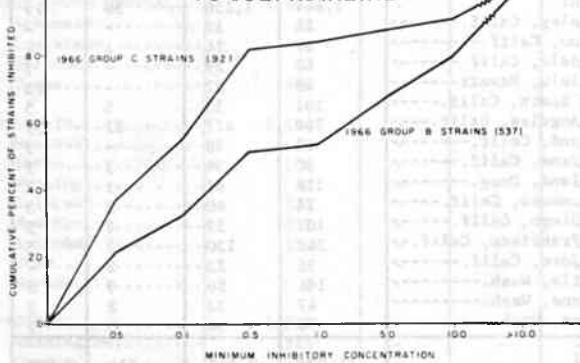

**Figure 4**  
**SUSCEPTIBILITY OF MENINGOCOCCI  
TO SULFADIAZINE\***

\*ISOLATED FROM BLOOD OR CEREBROSPINAL FLUID SUBMITTED TO THE NCDC

In Figure 5 the sulfonamide sensitivity of groups B and C *Neisseria meningitidis* is compared. In contrast to the generally more resistant group B meningococci, over 80 percent of group C strains were inhibited by 1 milligram percent or less of sulfadiazine. Nevertheless, 10 percent of group C strains were resistant to 10 milligrams percent sulfadiazine.

**Figure 5**  
**SUSCEPTIBILITY OF GROUP B AND C MENINGOCOCCI  
TO SULFADIAZINE**

(Reported by the Bacterial Diseases Section, Epidemiology Program; and Dr. Joseph H. Schubert, Bacterial Serology Unit, Bacteriology Section, Laboratory Improvement Program, NCDC.)

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 17,000, IS PUBLISHED AT THE NATIONAL COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

DIRECTOR, NATIONAL COMMUNICABLE DISEASE CENTER  
DAVID J. SENCER, M.D.  
CHIEF, EPIDEMIOLOGY PROGRAM  
ACTING CHIEF, STATISTICS SECTION
